Abstract (en)

[origin: WO2018162836A1] The invention concerns an arrangement for measuring the angular position of a rotary plate (12) intended for transporting a container, the arrangement comprising: - a plate (12) constrained to rotate about a central shaft (14) comprising an axially oriented axis of rotation (B); - an angular sensor (66) that comprises a rotary measuring shaft (68) and that is intended to measure an angle representative of the angular position of the plate (12); characterised in that the rotary measuring shaft (68) is rotationally coupled with the central shaft (14) according to a determined transmission ratio via a kinematic chain for transmitting motion comprising at least one transmission wheel (44, 76) offset radially relative to the central shaft (14).
