Abstract (en)
[origin: WO2018162369A1] A crosslapper intended to supply a layer of fibres as output on the basis of a web (1) of fibres supplied as input, the crosslapper superimposing sections of the web in order to form the output layer and comprising a front belt (2), a rear belt (4) and return means (3) intended to return the web of fibres so that it can be transitioned from a state in which it is supported by the front belt to a state in which it is supported by the rear belt, characterised in that a rotationally driven element, for example, a rotationally driven roller (20) or cylinder, is disposed substantially above the region of the web in which the return is performed.
