Abstract (en)
This disclosure relates to access management systems and platforms that are configured to perform functions associated with controlling access to remote sites and managing maintenance operations at the remote sites. The platform can aggregate data associated with the sites and/or assets located at the sites. The aggregated data can be analyzed to predict asset alert conditions indicating a potential failure or malfunctioning of the assets located at the remote sites. The platform can preemptively schedule maintenance operations to prevent failure or malfunctioning of the assets, and can provide individuals access to the sites to enable performance of the maintenance operations.
