Abstract (en)  
[origin: WO2018172106A1] The invention relates to a filter apparatus having a filter housing (1) having a fluid inlet (11) for raw fluid and having a fluid outlet (19) for filtrate and having at least one one-piece or multi-piece filter insert (7, 9) which is received in the filter housing (1) and can be cleaned using at least one back-flushing member (21) in counter-current to the filtration direction, which member can, by means of a fluid-guiding driveshaft (20) of a rotary drive, be moved along the inner side (17) of the respective filter insert (7, 9) and has, at the end of the back-flushing member adjacent to said inner side (17), a gap-shaped passage opening that runs parallel to the axis of rotation (16) of the driveshaft (20) and discharges into a flow space fluidically connected to the driveshaft (20). Said filter apparatus is characterized in that the distance between the respective back-flushing member (21) and the adjacent assignable filter insert (7, 9) is predefinable by means of an adjusting device (27; 47).
