Abstract (en)
[origin: WO2018167404A1] The invention relates to a method for detecting anomalies in a set of payment transactions, consisting of: - establishing (E3) a meta-model formed from a set of models, each trained on a training set in order to determine a risk for each transaction of being anomalous, the meta-model being established by the "gradient boosting" technique so as to optimize a differentiable function expressing the average precision of the meta-model; - submitting (E4) said set to the meta-model so as to determine risks for each transaction of said set, and - determining a subset of transactions corresponding to a risk that is greater than a determined threshold in order to provide a predetermined number of transactions in said subset.
