Abstract (en)

[origin: JP2020011846A] To provide a device and a method that enable manufacturing a printed product comprised of first printed paper that is laterally folded and second printed paper that is not folded.SOLUTION: An air compression device 17 of a device 1 includes a first controlling element 24 that is connected to a controlling unit 23 and is for inducing or controlling compressed air blast from at least one of outlet openings of the air compression device. Thereby printed paper can be induced into a second transportation segment 28 for folding or into a third transportation segment 32 for bypassing folding. A third transportation segment merges into the second transportation segment 28 at a common second middle point 29 at the downstream of a folding roll 12, and a fourth transportation segment 36 is connected at the downstream. As the first sequence of the printed paper continuing on the first transportation segment 5 is the same as the second sequence of the printed paper continuing on the fourth transportation segment, the third transportation segment is formed longer than the second transportation segment or can be operated slower than the second transportation segment.SELECTED DRAWING: Figure 1
