Abstract (en)  
A control device of a linear hydraulic actuator of an earth-moving machine is described, in which the device comprises a control valve provided with a first position in which it allows a supply flow of the operating fluid towards the hydraulic actuator and a second position in which it allows a discharge flow towards a distributor, an anti-vibration line which connects a pilot line of the control valve with a hydraulic line between the control valve and the distributor, and a pressure valve located in the anti-vibration line and configured to open at a certain pressure value when the movable member of the hydraulic actuator reaches the end of its stroke and if the operating fluid circuit is intact, in order to avoid an undesired generation of vibrations.
