Abstract (en)

[origin: WO2018178847A1] A wire harness test system designed to facilitate and harmonize the integration of electrical test modules into the test table is disclosed, making it more versatile and multipurpose in terms of the diversity of wire harness families that can be tested on the same equipment. In order to achieve these objectives there is a need to change the traditional concept underlying a traditional testing system, decentralizing the processing associated with the test itself, except for the use of racks or interface and expansion cards. The test system developed is intended for use in the wiring industry and aims at facilitating and harmonizing the integration of electrical test modules in the test table, making said table more flexible and capable of adapting to the test of different types of wire harness.
