Abstract (en)
[origin: WO2018178283A1] The invention relates to a lamp, which has light output means (1) for generating a (5) first light output and a second light output which differs from the first light output. The lamp also has control means (2) for acquiring input data (3) and for activating the light output means (1) depending on the input data (3) in such a way that the light output means (1) generate either the first light output or the second light output, wherein the input data (3) comprises (10) time information, information relating to the daylight, and presence information. The fact that the control means (2) are configured as a constituent part of the lamp means that a particularly simple configuration of the control of the light output means (1) can be achieved.
