Abstract (en)  
The present invention relates to a method of producing a coating liquid impregnated sheet-like reinforcing fiber bundle formed by applying a coating liquid to a sheet-like reinforcing fiber bundle that is unidirectionally arranged continuous reinforcing fibers long in one direction. A problem addressed by the present invention is to provide a production method and a coating device of a coating liquid impregnated sheet-like reinforcing fiber bundle, wherein the method and device can effect continuous running without clogging of generated fuzz even at a high running speed and effect efficient impregnation of a coating liquid into the sheet-like reinforcing fiber bundle. The present invention is a method of producing a coating liquid impregnated sheet-like reinforcing fiber bundle 1b, including allowing a sheet-like reinforcing fiber bundle 1a, which is unidirectionally arranged reinforcing fibers 1, to pass substantially vertically downward through the inside of a coating section 20 storing a coating liquid 2, whereby the method provides the sheet-like reinforcing fiber bundle 1a with the coating liquid 2; wherein the coating section 20 includes a liquid pool and a narrowed section which are in communication with each other; wherein the liquid pool has a portion whose cross-sectional area decreases continuously along a running direction of the sheet-like reinforcing fiber bundle 1a, and wherein the narrowed section has a slit-like cross-section and has a smaller cross-sectional area than the top side of the liquid pool.
