Abstract (en)  
[origin: CN209505744U] And a connecting system (10) of the rotating mechanism (5) and the walking part (2). Wherein the male connector (11) and the female connector (15) are located on the upper portion of a walking part (2) and the upper portion of a rotating mechanism (5) respectively and matched with each other; the full-open stop (18) is located at the bottom of the walking part (2) and abuts against the bottom of the rotating mechanism (5). The locking mechanism (23) locks the rotating mechanism (5) and the walking part (2); the longitudinal alignment centering device (29) is aligned with the rotating mechanism(5) and the walking part (2) at present; a safety device for connecting a rotary mechanism (5) to said walks (2) ensures that traction between the two parts continues to be effective in the event of a failure of a connecting rod connecting the two walks (2).
