Abstract (en)

[origin: EP3604414A1] For heightening the safety of lithium-ion batteries while attaining increases in the energy density and output thereof, it is important to make a separator have a smaller maximum pore diameter, a higher piercing strength, and a smaller transverse-direction melting-heat shrinkage. However, achieving a balance thereamong has been difficult. The present invention addresses the problem of solving the difficulty.

The present invention relates to a microporous polyolefin membrane characterized by having a piercing strength of 4.5 N or higher per membrane thickness of 20 µm and by comprising a polyolefin, the polyolefin having a molecular-weight distribution in which the proportion of components each having a weight-average molecular weight of 5.0×10^{6} or higher is 0.6-1.5%.
