Abstract (en)

[origin: WO2018185290A1] The invention provides agents for use in methods of saturation transfer mediated imaging (such as CEST imaging) in a subject, which agents comprise a liposome encapsulating a suitable sugar compound. The disclosure provides novel liposome formulations, which can be used for diagnostic and theranostic purposes. The liposomes can be shielded and/or targeted to a sugar uptake site such as a tumour. The invention has particular utility in modulating the glycaemic response to the encapsulated sugar compound in the subject.
