Abstract (en)

[origin: WO2018185393A1] The present invention relates to a lighting device for a motor vehicle including at least one areal light source formed by an organic light-emitting diode (11); characterized in that said organic light-emitting diode (11) is of flexible type (FOLED) and in that said device furthermore includes electromechanical means (13) able to interact with at least one portion (11B) of said FOLED (11) so as to bring about deformation thereof. The invention also targets an optical signalling unit including at least one such lighting device.
