Abstract (en)
[origin: WO2019072318A2] Disclosed herein are methods, devices, and apparatuses, including computer programs stored on computer-readable media, for establishing communication between a first node and a second node in a blockchain system. One of the methods includes: the first node providing a node identifier of the first node to the second node and receiving a node identifier of the second node from the second node, to cause a first communication session to be established between the first node and the second node; the first node determining whether a second communication session exists between the first node and the second node; and in response to a determination that the second communication session exists between the first node and the second node, terminating one of the first communication session and the second communication session based on the node identifier of the first node and the node identifier of the second node.
