Abstract (en)

[origin: WO2018190971A2] A surgical drill guide system has a modular configuration and allows for a number of interchangeable guide arms to be quickly and easily connected to a single handle. The surgical drill guide system has an ergonomically balanced design that allows the drill guide system to be removed while leaving a guide wire in its intended location in human bone. The distal end of the drill guide system acts as a safety stop for the guide wire by preventing the guide wire from penetrating too far past the far side of the bone.
