Abstract (en)
[origin: WO2018220073A1] The invention relates to a container, the opening of which can be closed by means of a lid (14). Latching means for releasably locking the lid are arranged in a region of overlap of the container wall (30) and the lid side wall (28). The latching means comprise separately inserted latching elements received in latching element receptacles, which latching elements have latching hooks (50), which can be brought into engagement with inversely corresponding latching hook receptacles (68) when the container opening is closed by means of the lid.
