Abstract (en)

[origin: EP3613884A1] A method for measuring the consumption of yarn for accumulation weft feeders wherein a control unit (CU) of an accumulation weft feeder (10) calculates the amount of consumed yarn C_m in a time interval comprised between an instant t₁ and an instant t₂ on the basis of the following formula: C_m=ERQ₁-ERQ₂+IPC*C where ERQ₁ is the estimated reserve amount on the drum (12) of the feeder at the instant t₁, ERQ₂ is an estimated reserve amount that is present on the drum (12) at the instant t₂, IPC is the number of winding pulses (WP) counted in the time interval between the instant t₁ and the instant t₂, and C is the length of the loop or fraction of loop wound on the drum. The estimated reserve amounts at the instants t₁ and t₂ are calculated on the basis of the number of winding pulses (WP) and of unwinding pulses (UWP), the latter being counted by an unwinding sensor (S3) and being generated from the instant when the weft reserve sensor (S2) switches its own state.
