Abstract (en)  
[origin: US2020063385A1] Provision is made according to the present invention that the receiving conveying device (36), in addition to swingable suspension (56) on the machine frame (12), is couplable by means of a second motion coupling (58), different from the first (53), to a component arrangement (24, 46) of the earth working machine (10) which is drivable to move relative to the machine frame (12), in such a way that a driven motion of the component arrangement (24, 46), from an initial position into a final position different therefrom, brings about a displacement of the swingably suspended receiving conveying device (36) away from the milling unit (26).
