Abstract (en)

[origin: US2020068325A1] An elastic damping element provides a vibration-damping mounting of a receiver inside a hearing instrument. The damping element contains a hollow base body, from the inner surface of which a plurality of retaining projections project, and each retaining projection has at its distal end a contact surface for the receiver that will be mounted there. A recess, which is formed in an outer surface of the base body in alignment with the associated retaining projection in order to achieve a reduced material thickness, corresponds with at least one of the retaining projections.
