Abstract (en)  
[origin: WO2018197231A1] The invention relates to a fluidic assembly comprising a fluidic component, the fluidic component comprising a flow chamber through which a fluid can flow, said flow of fluid entering the flow chamber through an inlet of the flow chamber and leaving the flow chamber through an outlet of the flow chamber. The fluidic assembly comprises at least one means for oscillating the flow of fluid, the oscillation occurring in an oscillation plane. The fluidic assembly is characterised by a device for diverting the oscillating flow of fluid flowing out of the outlet of the fluidic component, the diverting of the flow being time-variable.
