Abstract (en)

[origin: WO2019066739A2] The present invention is related to a mechanism that facilitates the installation on doors and windows of safety hooks that prevent burglars from opening doors and/or windows by stretching and straining the latch bolts through the application of force using crowbars or other tools on certain points on the door, using fitting blocks of varying widths, and that increases the visual appeal of the invention by hiding the installation screws.
