Abstract (en)

The present invention relates both to an element of the type used for forming gratings that serve as overflows in swimming pools and to the grating thus formed, where the element basically comprises two surfaces, an upper surface (1) and another lower surface (2), located at different heights, antislip means (4), and at least one suction channel (5) through which water flowing over from the swimming pool is discharged, as well as adjustable attachment means (7, 7') to allow varying both the distance and the angular position between contiguous elements in a coplanar manner between contiguous elements, where it can be used as an information channel as a result of the variation in color or shape of the antislip means.
