Abstract (en)  
The invention relates to a locking device (10) comprising: a first locking section (1), movable between a locked position and an unlocked position; a second locking section (2) arranged such that the first locking section (1), when in the unlocked position, is at least partially housed inside the second locking section (2); operating means (3), joined to the second locking section (2), rotatable between a first position and a second position; a first rod (4) and a second rod (5) connected to the operating means (3). According to the invention, the first locking section (1) is mechanically coupled to the first and second rods (4, 5) by means of first and second mechanical conversion means (60, 70) configured to convert an entry movement into an exit movement perpendicular to the entry movement, the first locking section being configured to push the panels, keeping the panels pressed together.
