Abstract (en)

[origin: WO2018201174A1] The invention relates to a collection assembly (1) for small amounts of body fluids, comprising a sample container (2) and an extender element (3). The sample container (2) has a base (13) and a container wall (5) with a first container wall section (6) and a second container wall section (7) adjoining same. The second container wall section (7) has a hollow cone shape and projects into the extender element (3). A coupling device (25) having a first coupling element (26) and a second coupling element (27) is also included. When the coupling elements (26, 27) are engaged in a coupling manner, the extender element (3) is coupled to the sample container (2) in an interlocking manner, in the form of a snap-connection, to form the collection assembly (1).
