Abstract (en)

[origin: WO2018202628A1] The invention relates to a method for cushioning objects (22a-c) in a container (20), said method comprising the following steps: a. detecting and/or determining a variable characterising a residual empty volume of the container (20) by means of at least one sensor, and b. automatically producing at least one cushioning means (64) depending on the variable characterising the residual empty volume of the container (20). According to the invention, a cushioning means (64) is produced only when this results from a comparison of the variable characterising the residual empty volume of the container (20) with a limit value.
