Abstract (en)

[origin: WO2018202805A1] The invention relates to a packaging system consisting of a packaging container and a separate packaging element for closing the packaging container, wherein the packaging container has a fiber molding as an outer molded structure and a molded single- or multilayer plastic film as a molded insert. The inner face of each lateral wall of the fiber molding is bonded to the insert solely in the upper sub-region of the lateral wall in each case, preferably on the upper edge of each lateral wall or on a peripheral flange optionally provided there. The insert together with the respective remaining regions of the inner face of each lateral wall extending to the base form a contact surface which has substantially the same shape but which is loose, and the fiber molding has at least one gas-venting opening, preferably multiple gas-venting openings, arranged in regular sections at least in the base region.
