Abstract (en)
[origin: WO2018204940A1] This invention describes the use of man- made cellulosic fibres, in particular lyocell and modal for the construction of ropes, nets and meshes for use as supports for the cultivation of marine cultures such as molluscs, particularly mussels and edible seaweed. The key properties are that the supports are of sufficient strength to carry the weights of the growing cultures without breakage yet are marine biodegradable after use.
