Abstract (en)
[origin: WO2018206692A1] The invention relates to an elastic joint filler cord (30) for arranging in the joint between two components, for example between a tile and an installed sanitary object. The joint filler cord is characterized in that the cord is tear-resistant. This can be achieved by a tear-resistant fabric (31) made of metal or plastic on the outer surface of the joint filler cord (30) for example. In order to renovate the joint, the joint filler cord (30) can be removed from the joint together with silicon material potentially adhered thereto by pulling.
