Abstract (en)
[origin: WO2018212724A1] The invention relates to a control arm for connecting a flap holder in an articulated manner to a flap, folding flap, door or the like, wherein, for adjusting its length, the control arm has at least one first telescopic arm and a second telescopic arm, which is guided in an adjustable manner on the first, and wherein the control arm has at least one securing device for fixing the position of the two telescopic arms. Provision is made here for the control arm to be assigned a latching connection, which acts between the telescopic arms, in the direction of the change in length of the control arm, and has at least two or more latching positions which are arranged along the change in length of the control arm and are spaced apart by a latching interval. The invention also relates to a lifting device with such a control arm and to a method for adjusting the length of such a control arm. The length of the control arm can be adapted straightforwardly and quickly to a respective flap, folding flap, door or the like.
