Abstract (en)

[origin: WO2018210596A1] The invention relates to a heat exchanger device for exchanging heat between air and a fluid guided in at least one heat exchanger (1), said device comprising a housing (2) with at least one inflow opening (3) and at least one outflow opening (4), at least one heat exchanger (1) being arranged in the housing and the or each heat exchanger (1) comprising a flow surface via which an air flow flows into the heat exchanger (1). In order to homogenise the air flowing over the flow surface of the or each heat exchanger, at least one air-guiding element (5) is associated with each heat exchanger (1), said air-guiding element being arranged inside the cross-section (Q) of the flow surface of the respective heat exchanger (1), where the air flows, splitting the air flow flowing through the inflow opening (3) into at least two partial flows (S1, S2) and deflecting at least one partial flow (S1) towards the respective heat exchanger (1).
