Abstract (en)
[origin: WO2020057875A1] The invention relates to a winding machine (1). According to the invention, a top thread guide (14) is guided for sliding with one degree of freedom (19) relative to a frame (2) of the winding machine (1). If a thread guide mechanism (4) performs a compensating movement (23) along a degree of freedom (6) during the winding journey because of an enlargement of the diameter of a winding formed on a spindle (3), a corresponding movement of the top thread guide (14) along the degree of freedom (19) can be performed in such a way that a run-in angle β of the winding material (11) into the thread guide mechanism (4) does not change over the winding journey.
