Abstract (en)
[origin: WO2018219774A1] The invention relates to an underwater transport container (10). The underwater transport container (10) has a front section (20), a central section (30), and a rear section (40), and the underwater transport container (10) has a cylindrical base shape for storing in a gun barrel (160). The central section (30) has at least one stowing region (90), the front section (20) has at least one first buoyancy compensation element (50), and the rear section (40) has at least one second buoyancy compensation element (60), wherein the first buoyancy compensation element (50) and the second buoyancy compensation element (60) are arranged in the interior of the underwater transport container (10). The front section (20) has at least one first surface buoyancy element (70), and the rear section (40) has at least one second surface buoyancy element (80). The first buoyancy compensation element (50) and the second buoyancy compensation element (60) are suitable for adapting the buoyancy to the ambient conditions. The first surface buoyancy element (70) and the second surface buoyancy element (80) can be switched between a compact state in the interior of the underwater transport container (10) and a buoyancy-generating state.
