Abstract (en)

[origin: WO2018215407A1] The invention relates to a LIDAR device for scanning a scanning region with at least one beam, comprising at least one beam source for generating the at least one beam and for coupling the at least one beam into at least one optical waveguide, a deflection device for deflecting the at least one beam into the scanning region, and comprising a receiver unit for receiving at least one beam reflected on an object and for deflecting the at least one reflected beam onto a detector, wherein the deflection device has a holographic optical element and a spatial light modulator.
