Abstract (en)
A ski pole comprises means to hold a hand of a user substantially fastened to an upper end portion (4) of a shaft (2) while allowing a pivoting movement of the hand of a user with respect to this portion around an axis (6) extending substantially transversally to the running direction of a user when skiing for allowing the user to let loose the grip of the hand around a hand grip (3) of the ski pole at an end phase of a pole-pushing. The ski pole comprises a rigid element (13) secured to an upper end (14) of the shaft to project forwardly from the shaft in the running direction of the user when skiing and the shaft being in a state of extending vertically. A substantially rigid support member (7) of the holding means is pivotally connected to the element around said axis (6) at a location displaced forwardly with respect to the shaft in said state.
