Abstract (en)

[origin: WO2018229186A1] The invention pertains to the field of chemistry and construction and relates to surface-modified glass fibers for reinforcing concrete, such as those which can be used in textile-reinforced concrete (textile concrete) for example. The aim of the invention is to provide surface-modified glass fibers for reinforcing concrete, said glass fibers being at least substantially protected from an exposure to alkali due to calcium hydroxide which is released during the cement reaction process and/or dissolution and leaching processes generated thereby. This is achieved by surface-modified glass fibers for reinforcing concrete, said glass fibers being at least partly coated at least with hydrolysis-stable and alkali-resistant cationic polyelectrolytes and/or a hydrolysis-stable and alkali-resistant cationic polyelectrolyte mixture and/or a hydrolysis-stable and alkali-resistant polyelectrolyte complex and coupled to the glass fiber surface via a (polyelectrolyte) complex formation process by means of an ionic bond, thereby forming the hydrolysis-stable and alkali-resistant polyelectrolyte complex A, wherein at least one additional (co)polymer at least partly coats the polyelectrolyte complex A and is coupled to the polyelectrolyte complex A via ionic and/or covalent bonds.
