Abstract (en)  
[origin: WO2018228686A1] The invention relates to a parking lock arrangement (5), comprising: a controllable locking mechanism (6) for blocking a drive element (3) in the drive train of a motor vehicle, wherein the locking mechanism (6) comprises a spindle drive (8) having a spindle shaft (9), an actuator (10) for driving the spindle shaft (9) and an actuating element (11), which is movable by rotating the spindle shaft (9), for activating a locking element (12), which has a blocking or releasing effect on the drive element (3), and an unlocking mechanism (7) for forced unlocking of the locking mechanism (6), wherein the unlocking mechanism (7) has an unlocking element (39) and an actuating element (40), which can be manually actuated, wherein the unlocking element (39) is movable by means of the actuating element (40) from a normal position, in which the unlocking element (39) is spaced apart from the spindle shaft (9), to an engaged position, in which the unlocking element (39) is connected to the spindle shaft (9) in a torque-transmitting manner in order to forcibly unlock the locking mechanism (6). The invention, furthermore, relates to a drive unit having such a parking lock arrangement (5).
