Abstract (en)

[origin: ES2754793A1] Cooking appliance device. The present invention relates to a cooking appliance device (10), in particular a cooking range device, with a control unit (12) which is intended to activate and supply energy to at least a first objective of induction (56) from a first energy source and at least one second induction target (58) from a second energy source. In order to improve the properties related to activation, it is proposed that, in the case of having at least one cooking battery (44) that is both part of the first induction target (56) and part of the second induction target (58), the control unit (12) is provided to define at least one common induction target (14) and to enter at least a special operating state to at least reduce coupling noise by at least one specific activation of the first and second induction targets (56, 58).
