Abstract (en)

[origin: WO2018234474A1] The invention relates to a band clasp (10, 100, 200, 300), particularly a wristwatch band clasp, including a device (4) for finely adjusting the length of the band. The adjustment device is preferably arranged on a central support structure so as to emerge from a free end of the latter. A latching mechanism (3) is designed such that the activation of a manipulation member (7, 7') causes the movement of a part of the fine adjustment device, so as to unlock a moving part (5) and allow the adjustment of the useful length of the band.
