Abstract (en)  
[origin: EP3643200A1] The present application describes a lift system for furniture. The present application describes a lift system for furniture that comprises an upper structure and a lower structure with a guide rail connected by at least two support arms comprised of sliders at one of the ends and intersect in a scissor-like structure, a system's actuator/lock and a spring system attached to the above-mentioned upper and lower structures, and an intermediate point on the scissor-like structure. The lift systems that are currently known require additional effort on the user's behalf in order to raise the upper structure into the ideal position. The technical solution presented herein is intended to allow the user to perform the height adjustment operation easily and effortlessly.
