Abstract (en)

Provided is titanium copper having improved stress relaxation resistance, a method for producing the titanium copper, and an electronic component using the titanium copper. A titanium copper, the titanium copper containing from 2.0 to 4.5% by mass of Ti, and a total amount of from 0 to 0.5% by mass of at least one selected from the group consisting of Fe, Co, Ni, Cr, Zn, Zr, P, B, Mo, V, Nb, Mn, Mg, and Si as a third element, the balance being copper and inevitable impurities, wherein an area ratio of crystal grains with a GOS (Grain Orientation Spread) of from 2 to 6° when an orientation difference of 5° or more is regarded as a crystal grain boundary in crystal orientation analysis in an EBSD measurement on a rolled surface is from 60 to 90%, and an area ratio of crystal grains with a Schmidt factor of 0.35 or less is from 5 to 20%.
