Abstract (en)

[origin: EP3648437A1] This application discloses a method and an apparatus for associating an application with a network slice, and a communications system. The method includes: obtaining, by a terminal, display instruction information, an identifier of a first network slice that the terminal is allowed to access, and service feature information corresponding to the first network slice; displaying the service feature information corresponding to the first network slice on a first display interface of the terminal based on the display instruction information; and generating a first network slice selection policy when detecting an operation of associating a first application with the first display interface, where the first network slice selection policy includes a mapping relationship between the first application and the identifier of the first network slice corresponding to the first display interface. In this way, a mapping relationship between an application and a network slice can be configured on a terminal side based on a user requirement, thereby improving user experience.
