Abstract (en)

[origin: US2019012645A1] A transaction authorization request message is received. The message includes a payment token and a merchant identifier. The payment token is detokenized to detect account mapping for the payment token. From the account mapping, it is determined that a debit transaction option and an ACH (automated clearing house) transaction option exist for the payment token. A selection is made between the debit transaction option and the ACH transaction option based at least in part on the merchant identifier.
