Abstract (en)

[origin: WO2019007546A1] The invention relates to a cable guiding means for arrangement on a profiled bar of a profiled carrier system, which is provided with a profile engagement section to engage in a profiled bar and has a cable guiding section which is formed as a ring-like cable holder. The aim of the invention is to devise a possible way of being able to mount one or more cables of a device at the most arbitrary points one-handedly and to remove the same again without destroying the cable guiding means. This aim is achieved, according to the invention, in that the cable guiding section is displaceably insertable in respectively one groove of the profile bar and has two intrinsically rigid limbs, of which at least one is elastically deflectable, wherein the two limbs are arranged on the circumference of the cable guiding section with their end regions overlapping and, at least in an elastically deflected state of one of the two limbs, are arranged at a distance from each other.
