Abstract (en)

[origin: CA3118662A1] A cable guiding device for an aerial cableway system comprising at least one elongate cable support (23). The device further comprises a single pair of similar connections (39), by means of which the cable support is securely mounted on an aerial support structure. The connections (39) are arranged at a distance from one another in a longitudinal direction of the cable support (23). Each connection (39) comprises at least one corresponding damping block (59) which is inserted between the cable support (23) and the support structure (7). Each connection (39) of the pair is designed as a pseudo-embedded type connection capable of transmitting forces in the manner of a ball joint, with the effect of the damping block or blocks (59).
