Abstract (en)

[origin: WO2019012464A1] An hydraulic tap (11) comprising: - a tap body (13) arranged to be fastened to a supporting surface; - a delivery spout (15) associated with the tap body (13) for discharging a liquid passing through the tap body (13) and the delivery spout (15), to the outside of the tap (11), wherein the delivery spout (15) comprises a distal portion (21) telescopically extendable relative to a proximal portion (19), and wherein at least one system (27) for stopping relative rotation and/or sliding between the proximal and distal portions (19, 21) is provided between said proximal and distal portions (19, 21), which system comprises a stopping member (33) supported by an elastic element (37) arranged to keep the stopping member (33) in contact with the surface of the spout portion radially distal from the elastic element (37), characterised in that the elastic element (37) comprises at least one elastic O-ring (37a, 37b) arranged on a plane substantially perpendicular to the longitudinal axis of the corresponding proximal or distal spout portion (19, 21) with which the stopping member (33) is associated.
