Abstract (en)

[origin: WO2019013717A1] The present invention proposes an elongate post (100) for securing fences thereon, having an essentially mushroom-shaped cross-section which is essentially symmetrical around a symmetry axis (A), comprising the following portions integrally ordered along the symmetry axis (A) at each side of the symmetry axis (A): a first portion (110) having a mainly convex outer face (111) and an essentially flat inner face (112); the first portion (110) having a width (W) parallel to the inner face (112), and a depth (d) along the symmetry axis (A); a second portion (120) having a maximum distance (h2) to the symmetry axis (A) which is mainly equal to a minimum distance (h1) of the inner face (112) to the symmetry axis (A), the second portion (120) forming an essentially flat side surface (121) along a depth (D) mainly perpendicular to the inner face (112) and mainly parallel to the symmetry axis (A); and a third portion (130) delimiting the depth (D) by having a support surface (132) with a distance (h3) to the symmetry axis (A) which is greater than the maximum distance (h2) of the second portion (120) at the end of the second portion (120) distal to the first portion (110). The present invention further proposes a fence assembly (1000) including such post (100).
