Abstract (en)

[origin: EP3654070A1] The present application discloses an X-ray detection system and method. The detection system includes: a beam source generator, first detectors, a second detector, a collimating device and a processor. The first detectors and the second detector are alternately arranged in a transmission direction of an object to be detected. The beam source generator is configured to emit a plurality of columns of beam signals, wherein each column of beam signals comprises a plurality of beam signals; the first detectors are configured to receive a plurality of columns of transmitted beam signals passing through the object; the collimating device is configured to perform a specificity selection from a plurality of columns of scattered beam signals passing through the object; the second detector is configured to receive scattered beam signals selected by the collimating device; and the processor is configured to determine a detection result of the object according to the plurality of columns of transmitted beam signals and the selected scattered beam signals.
