Abstract (en)

[origin: WO2019015958A1] The invention relates to a fire extinguishing system valve (1), having a housing (2), a fluid inlet chamber (11) provided in the housing (2), a fluid outlet chamber (13) provided in the housing (2), and a closing body (9) which can be moved back and forth between a blocked state and a released state. In the blocked state, the closing body (9) prevents a direct flow of fluid between the fluid inlet chamber (11) and the fluid outlet chamber (13) and in the released position, said closing body (9) connects the fluid inlet chamber (11) to the fluid outlet chamber (13) directly in a fluid-conducting manner. According to the invention, the fire extinguishing system valve (1) has at least one manometer (15, 17), which is operatively connected to the fluid inlet chamber (11) or fluid outlet chamber (13) and is mounted on the housing (2), and a ventilation device (21) for the at least one manometer (15, 17), said ventilation device (21) being integrated in the housing (2).
