Abstract (en)
[origin: WO2019015864A1] The present invention relates to a container having a plurality of chambers or sub-containers (12). Same are connected to one another at least in some sections along an axis which corresponds to a longitudinal axis or a parallel line to the longitudinal axis or along a spiral shape. A central element (16) which can be produced together with the sub-containers (12) has proven itself for a connection of this kind. Outside said connections, the sub-containers are separated from one another substantially by air gaps (18). The container according to the invention makes it possible to jointly store and transport various materials, such as liquids in particular, wherein said materials are well thermally insulated from one another.
